## **EDUCATION**

#### **North Carolina State University**

Aug 2025 - May 2027

Master of Science (MS), Computer Engineering (GPA: 4.00/4.00)

Raleigh, North Carolina

• Coursework: Microprocessor Architecture, Embedded Systems Architecture, Object-Oriented Design and Development, Advanced Microarchitecture, Architecture of Parallel Computers, Compiler Optimization and Scheduling, Operating Systems

#### **RV** College of Engineering

Aug 2019 - Jun 2023

Bachelor of Engineering, Electronics and Telecommunication (GPA: 7.9/10)

Bangalore, India

## **WORK EXPERIENCE**

# **AIRBUS** | Embedded Software Engineer

Jul 2023 - Jul 2025

Contributed to the development of firmware for the Flight Warning Computer on Next-Gen Single Aisle Aircraft (A320s), demonstrating C/C++ and embedded systems expertise.

- Exposed to hardware-software integration, requirement-based testing, and real-test bench debugging using Trace32 and GDB, which aligns with rigorous firmware testing and debugging practices.
- Solely responsible for performing **Static Analysis** of the Flight Warning application using the **Astrée** tool to ensure compliance and software reliability.
- Engineered a CI/CD pipeline leveraging Jenkins, achieving a 50% reduction in build and deployment time and substantially optimizing the development workflow.
- Integrated the **SDAC** (System Data Acquisition Concentrator) test bench configuration with the Flight Warning Computer by introducing a **LUA** based graphical user interface, mitigating resource constraints, and increasing productivity by 30%.

#### **AIRBUS** | Engineering Intern

Mar 2023 - Jul 2023

Designed automation scripts using Python to streamline firmware configuration and verification under DO-178C guidelines.

- Developed an auto-process tool to automate the Change and Configuration Management process, aligning with systematic firmware documentation practices.
- Automated migration of 34 software components to the latest toolchain using Python and Shell scripting, reducing migration time by 80%.
- Enhanced cockpit simulation by optimizing over **15,000** signals using Python profiling, leading to a **15%** boost in computational performance and reduced system latency.

## **TECHNICAL SKILLS**

- **Programming & Core Languages:** C++, Embedded C, Python, Robot framework, Assembly Language, Shell Scripting, Ruby, object, Object Oriented Programming, Data Structures and Algorithms
- Embedded Systems & Real-Time Systems: Bare-Metal Programming, RTOS, Microcontrollers, Digital Signal Processing, Interrupt Handling, Low-Level Driver Development, Firmware Architecture, Bootloaders, Memory Management, UART, Arinc, MATLAB, Simulink
- Hardware & Debugging: Lauterbach Trace32, GDB, ARM Cortex-M, GPIO, Logic Analyzer, Keil, Polyspace, Astrée, Unit Testing, Hardware-in-the-Loop (HIL) Testing
- Build and Deployment Tools: Makefile, Jenkins, Git, Jira, Continuous Integration & Deployment (CI/CD), Linux/Unix
- Software Development Lifecycle: Agile Methodologies, Requirement-Based Development, Documentation, Component-based development

#### **PROJECTS**

## Cache and Memory Hierarchy Simulator with Stream Buffer Prefetching (C++)

- Developed a configurable simulator for multi-level cache hierarchies (L1, L2) supporting adjustable size, associativity, and block parameters.
- Implemented a **stream buffer prefetching unit** to model speculative data access and analyzed performance metrics such as hit/miss rates and average access time. Evaluated system-level trade-offs in **latency**, **bandwidth**, **and energy** using CACTI models, reinforcing concepts in **performance modeling and firmware-level optimization**.

# Superscalar Pipeline Simulator (C++)

- Developed a cycle-accurate simulator for an out-of-order (OOO) superscalar processor to model dynamic instruction scheduling.
- Implemented core microarchitectural components essential for OOO execution, including a Reorder Buffer (ROB), a unified Issue Queue (IQ), and a Rename Map Table (RMT). Modeled the complete multi-stage pipeline (Fetch, Decode, Rename, Register Read, Dispatch, Issue, Execute, Writeback, and Retire) to resolve true data dependencies an
- Analyzed processor performance by processing instruction trace files to generate detailed cycle-by-cycle timing reports and calculate final metrics like Instructions Per Cycle (IPC).

# **Branch Predictor Simulator (C++)**

- Designed and implemented a RISC-V branch prediction simulator in C++ supporting bimodal, gshare, and hybrid predictor architectures.
- Modeled dynamic two-bit counter tables and chooser logic to measure **misprediction rates**, accuracy, and pipeline efficiency across configurations. Optimized simulator runtime and validated against benchmark traces to study trade-offs in **accuracy**, **hardware complexity**, **and pipeline performance**.

#### Adaptive Modulation and Detection using Machine Learning (Matlab)

- Designed a machine learning model to perform automatic modulation classification (AMC) on signals using adaptive modulation techniques.
- Developed and trained a deep neural network (DNN) to predict the modulation scheme (e.g., QPSK, 16-QAM, 64-QAM) of a received signal, overcoming the errors and quality loss of traditional demodulation.
- Utilized Python, MATLAB, and Jupyter Notebook to pre-process signal datasets, build the ML architecture, and train the model to minimize loss.
- Evaluated model performance by comparing its classification accuracy against other established architectures, including CNN, LSTM, and PCA.
